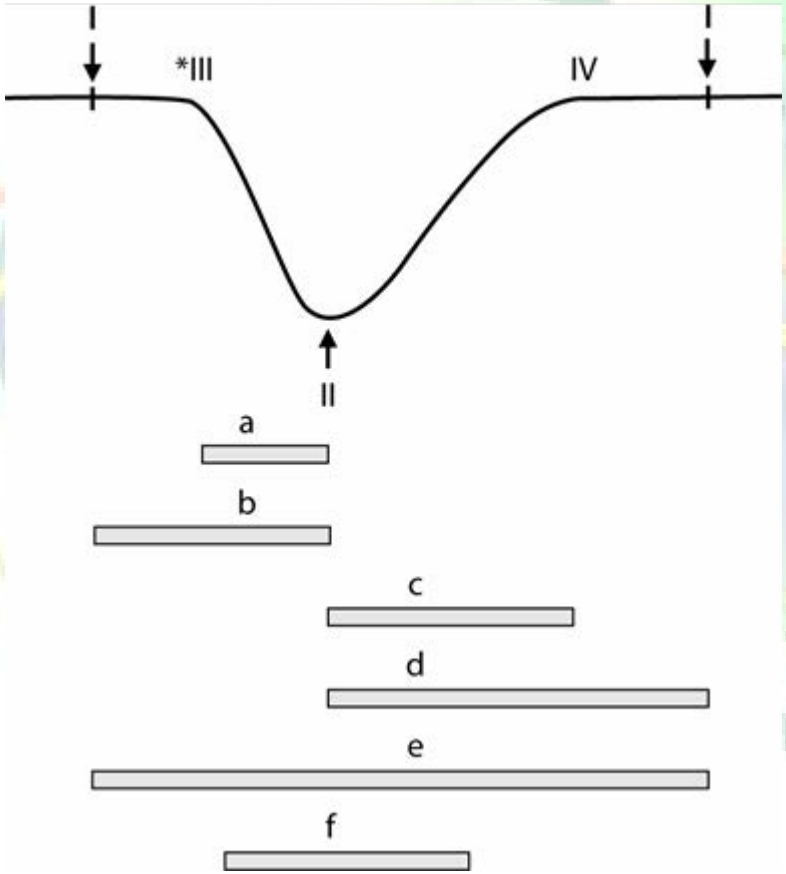
The electroglottical curve at the laryngeal level



- **I:** maximum opening of the glottis
- **II:**maximum closing of the glottis (stroboscopically determined and transferred from the electroglottography curve).
- **III** and **IV** represent the change in resistance during the transition between these two states

Range of fundamental frequency 15% pr centiles from 1-784 Hz

- ***Above**: Fundamental frequency of the speaking voice, tonal range of the speaking voice and tonal range of the singing voice for boys compared to body height (ordinate) and age (abcissa).*

- ***Below**: Fundamental frequency of the speaking voice [Hz] compared to serum testosterone level [nmol/l]. The abcissa shows the age in years. The arrows indicate the change of voice (above: End of the change; below: Beginning and end of the change).*

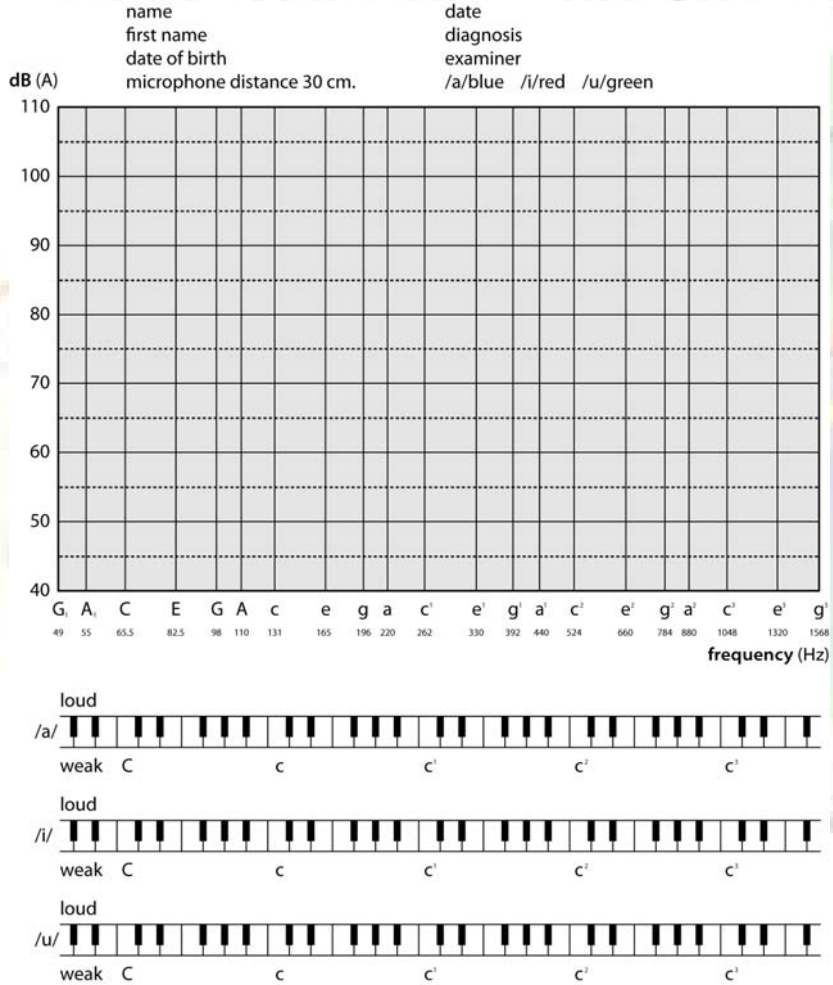
The phonetogram structure



Form for phonetogram measurement according to the 1981 UEP standardisation proposal.

Reproduction of the semitones is given with 30 cm distance and measured with an intensity meter from Bruel and Kjær, Type 2208

M. Pedersen, FRSM Dr.med.Sci. Et h.c. ENT specialist, The Medical centre, Østergade 18 3. DK – 1100 Copenhagen Denmark
Url:www.mpedersen.org

- Planimetry was made on paper in the study of the normal development.To calculate the area of voice intensity versus fundamental frequency, one cm2 was comparable to 32 dB(A) x semitones.

- Later on, we constructed a **phonetograph hardware** where the semitones were given automatically, whereafter a filter secured the voice source fundamental frequency.

- The maximal and minimal intensity was measured averaging 10 equal sinus curves respectively.

- Later on, we developed a software program known as PG 100. PG 200 is an averaging program with standard deviations of the measured tones**.**

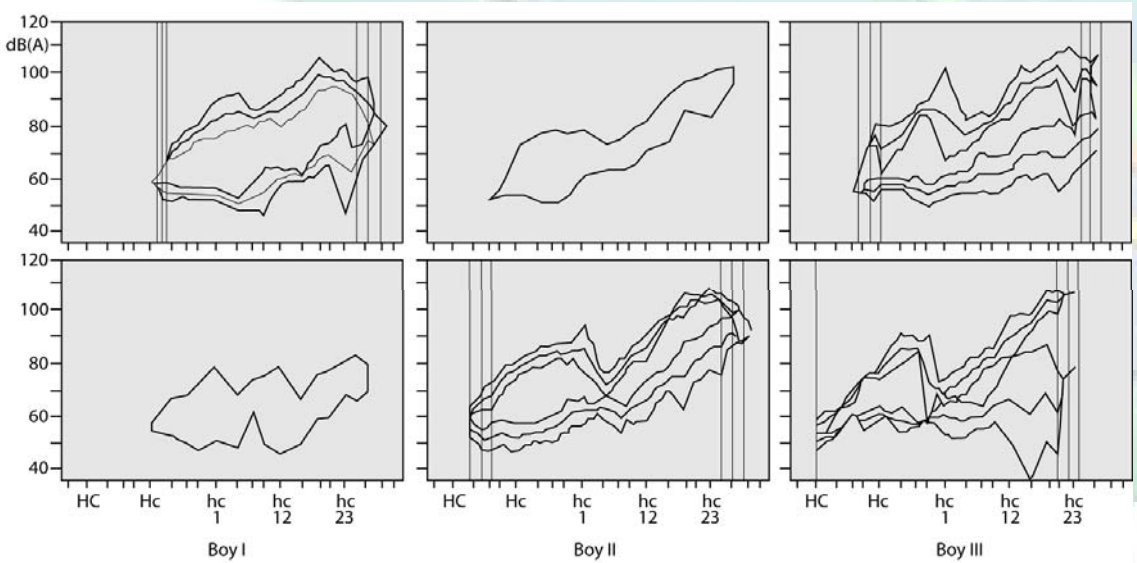
Url:www.mpedersen.org

Average of phonetograms, made with PG200



- Average phonetograms and standard deviations for the three choirboys (I – III) involved in the prospective longitudinal study.
- The phonetograms before and after the change of voice were compared.
- For test person I and II, only one phonetogram was made in mutation and before mutation respectivetly.
- For test person III, three phonetograms were measured before and three during the change of voice.

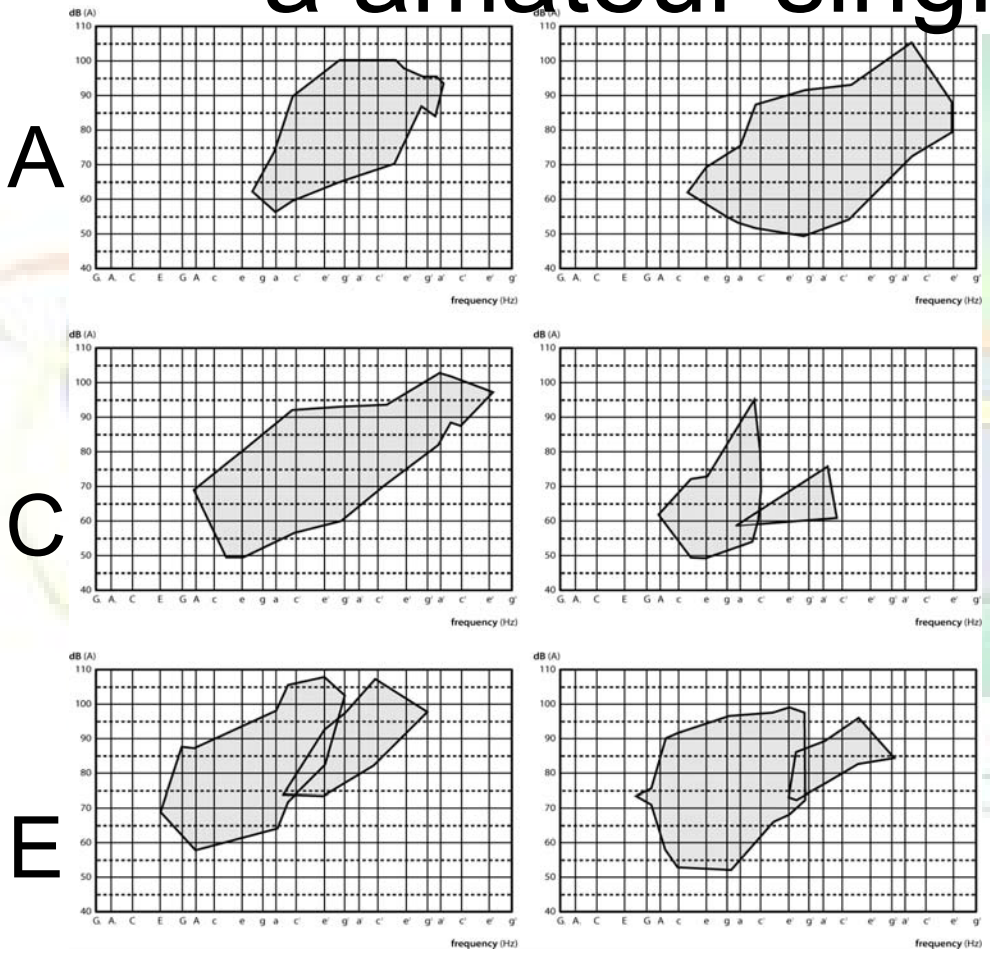
48 boys & 47 girls from 3-11 degree in a amateur singing school



- This was made using the model from the Union of European Phoniatricians 1981.
- Average phonetograms for boys and young men, depending on voice type. (The voice type was determined by the singing teacher.)
- **A:** Beginner
- **B:** Soprano
- **C:** Alto
- **D:** Voice in puberty
- **E:** Tenor
- **F:** Bass

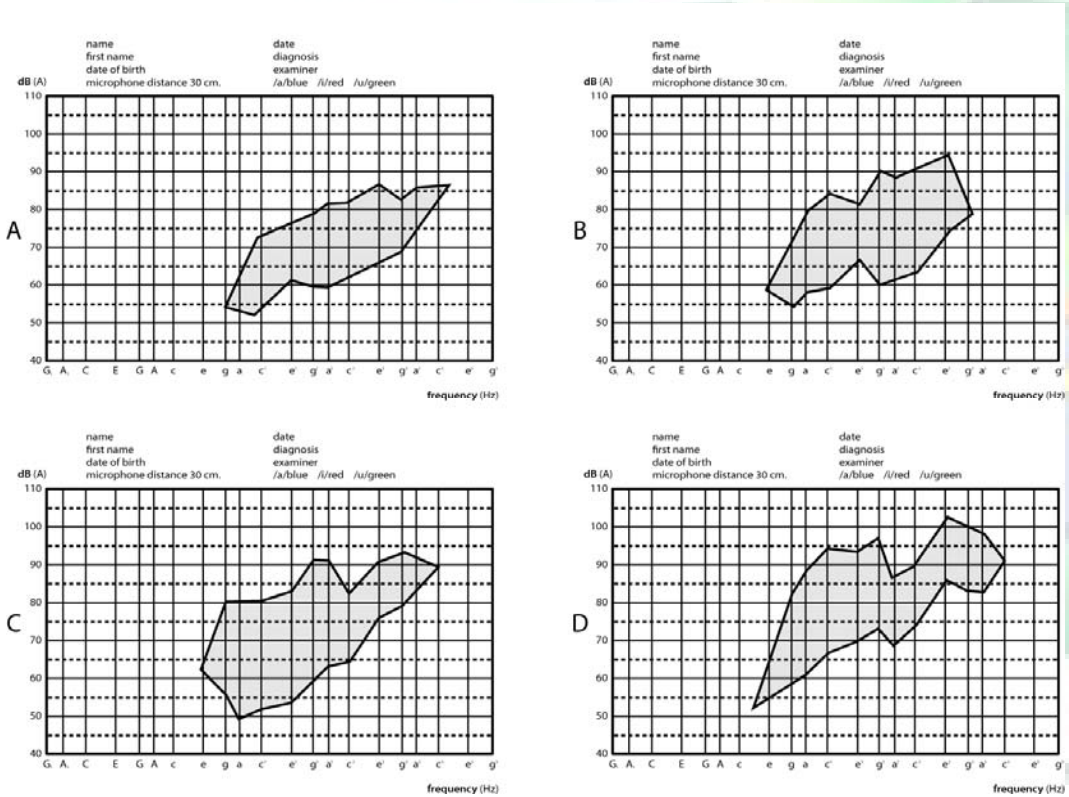
48 boys & 47 girls from 3-11 degree in a amateur singing school



- Phonetograms for girls of different ages.
- **A** (8.9 yrs.) – Beginner in the choir.
- **B** (11.7 yrs.) - Typical child's voice with change of register (330 - 392 Hz).
- **C** (13.8 yrs.) – Well-trained voice without register changes with limited dynamic breadth.
- **D** (14.8 yrs.) – Pubertal voice with register changes.

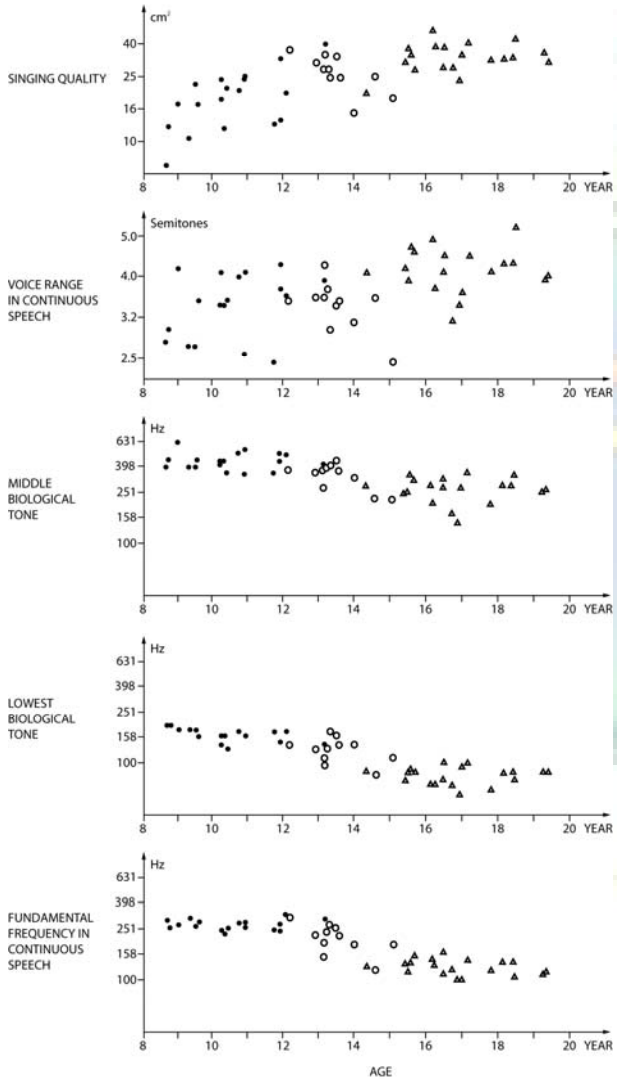
Development of fundamental frequency in boys



- Graphical representation of:
  - the phonetogram areas
  - the tonal range of the speaking voice
  - the deepest and the mean note in the phonetogram
  - the fundamental frequency of the speaking voice for boys as a function of age (abcissa):
    - (•) 8,7 -12,9 years,
    - (O) 13 - 15,9 years,
    - (Δ) 16 - 19,5 years.

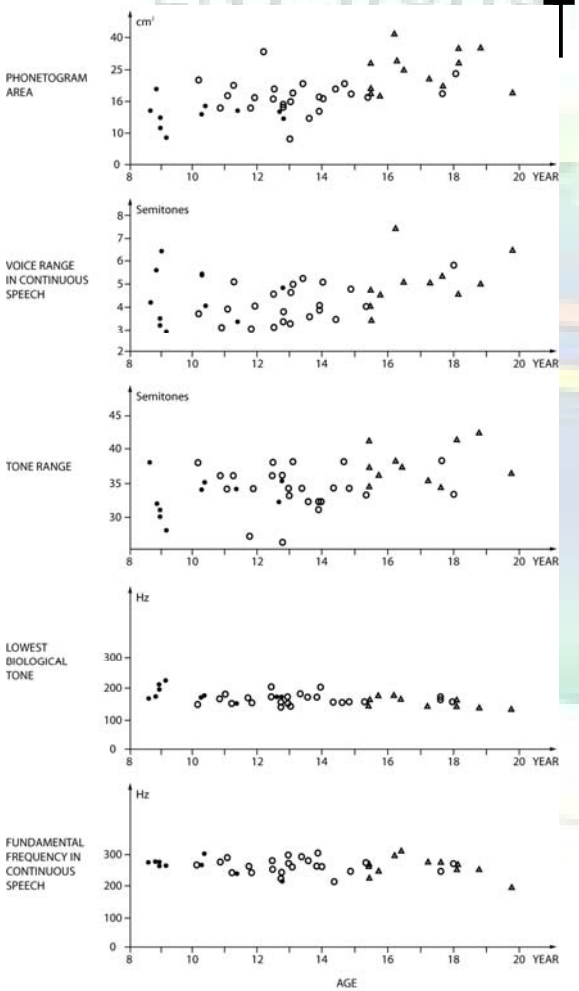
Development of fundamental frequency in girls



- Graphical representation of:
  - vocal parameters phonetogram areas,
  - tonal range of the speaking voice
  - tonal range of the singing voice
  - deepest note in the phonetogram
  - fundamental frequency of the speaking voice for girls as a function of age (abcissa):
    - (•) Breast development stage 1
    - (O) Breast development stage 2 – 4
    - (Δ) Breast development stage 5 - 6

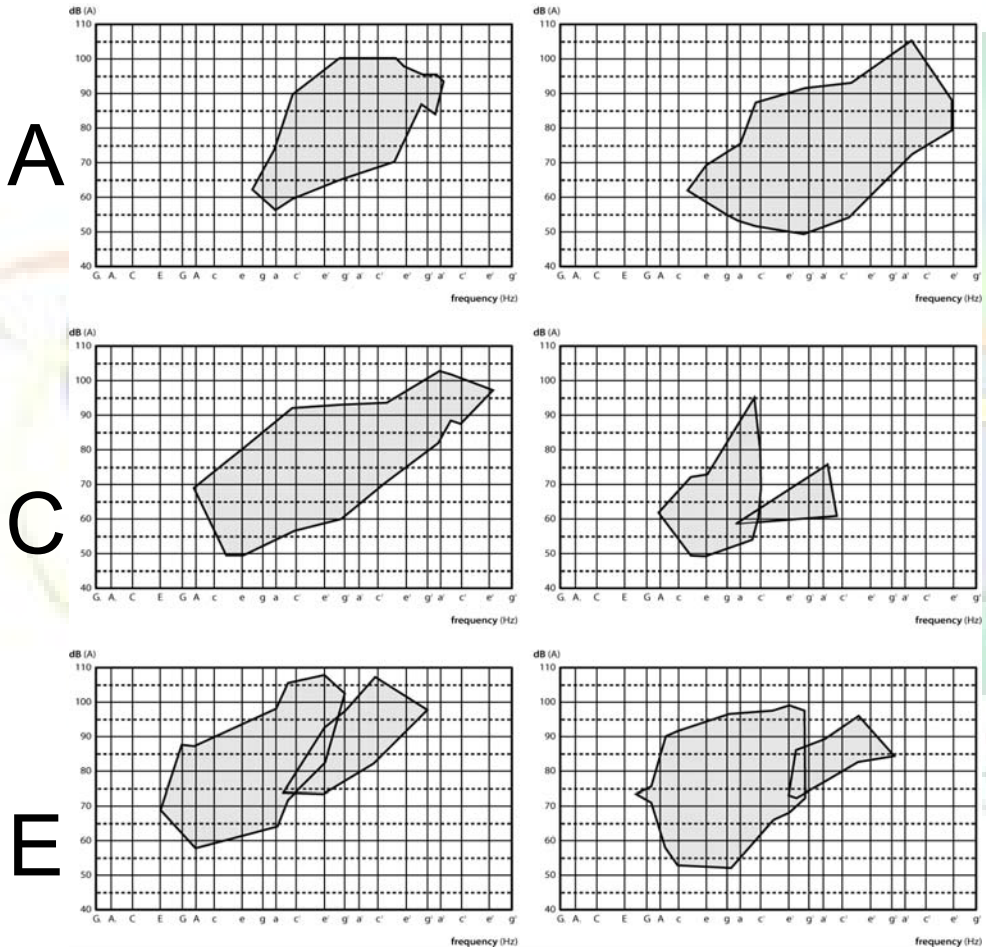
Examples of phonetograms in boys before and after puberty



- Average phonetograms for boys and young men, depending on voice type. (The voice type was determined by the singing teacher.)

- **A:** Beginner
- **B:** Soprano
- **C:** Alto
- **D:** Voice in puberty
- **E:** Tenor
- **F:** Bass

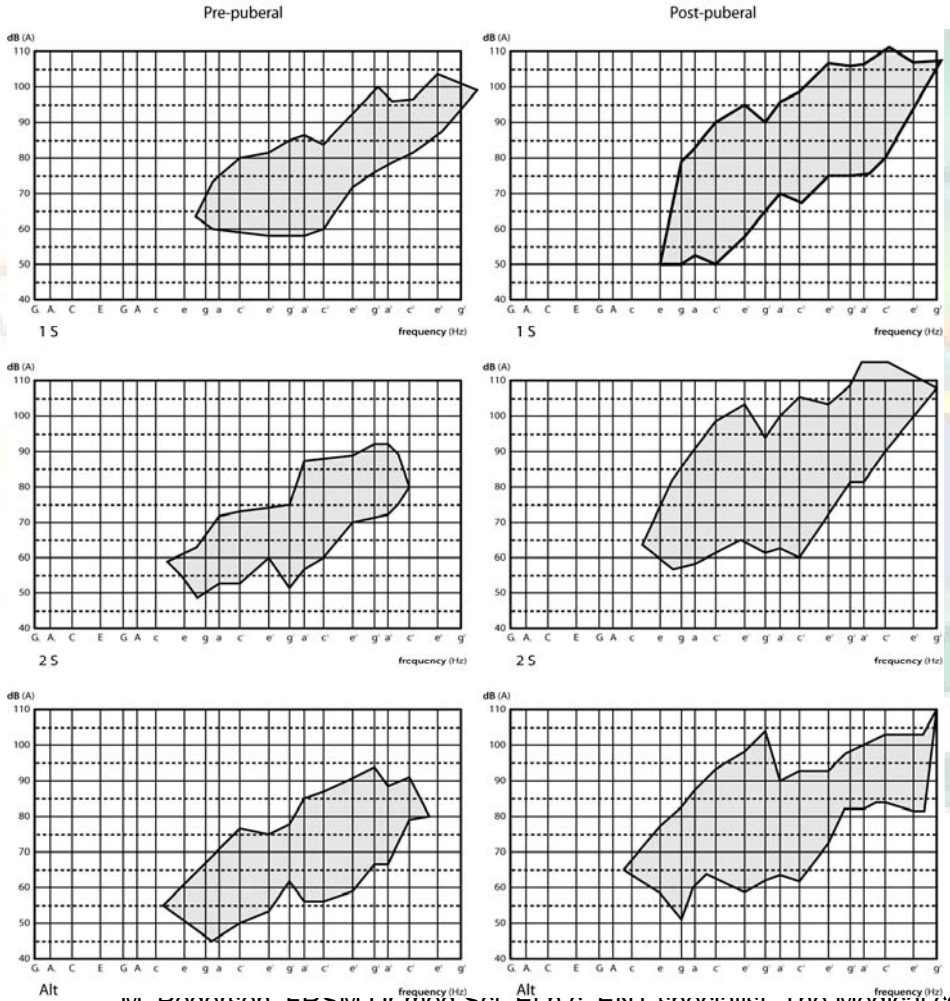
Url:www.mpedersen.org

Examples of phonetograms in girls before and after puberty



- Phonetograms for girls of different voice types.
- In the upper frequency range, there is a bigger intensity for the sopranos, and in the lower frequency range for the altos.

M. Pedersen, FRSM Dr.med.Sci. Et n.c. ENT specialist, The Medical centre, Østergade 18 3. DK – 1100 Copenhagen Denmark

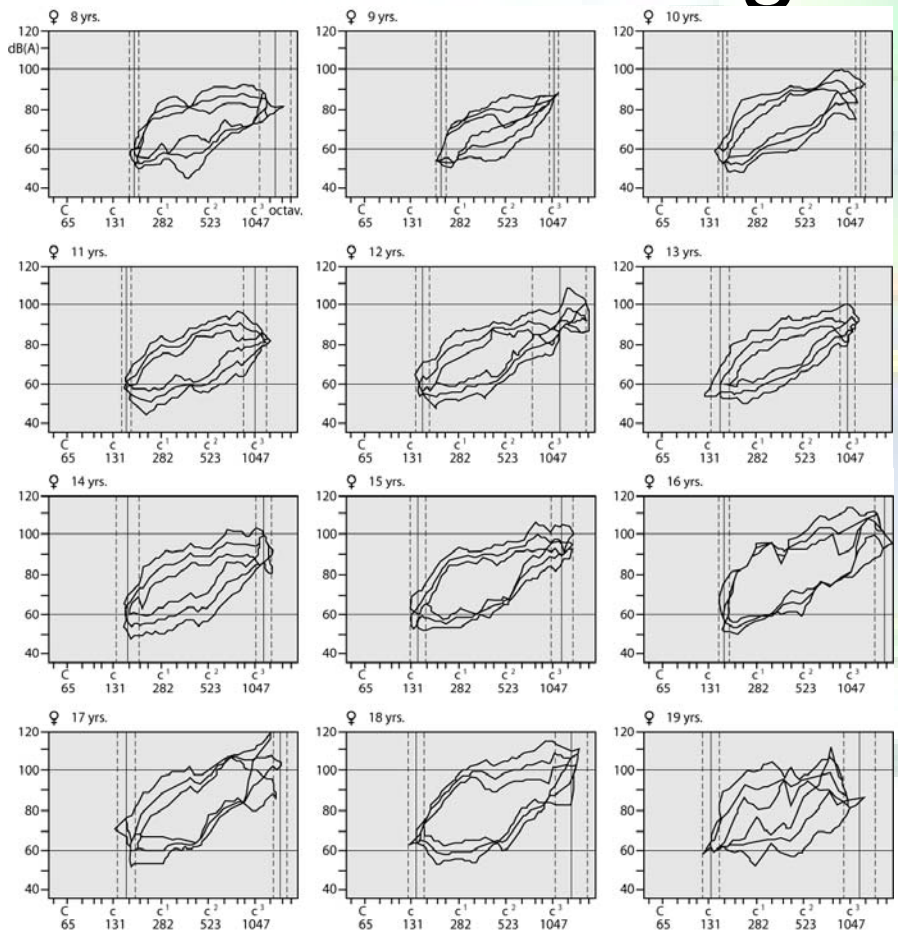
Average pr. year of phonetograms in girls



- Average phonetograms for girls with standard deviations, as a function of age.
- The abcissa is divided up into semitones, with the frequency in Hertz for each octave marked. The scale on the ordinate is in dB(A).

M. Pedersen, FRSM Dr.med.Sci. Et h.c. ENT specialist, The Medical centre, Østergade 18 3. DK – 1100 Copenhagen Denmark

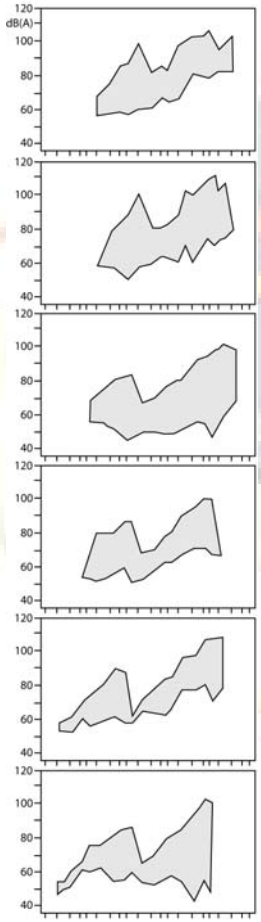
Pubertal development in a longitude study with measure every second month in the 8th school year, 3 boys

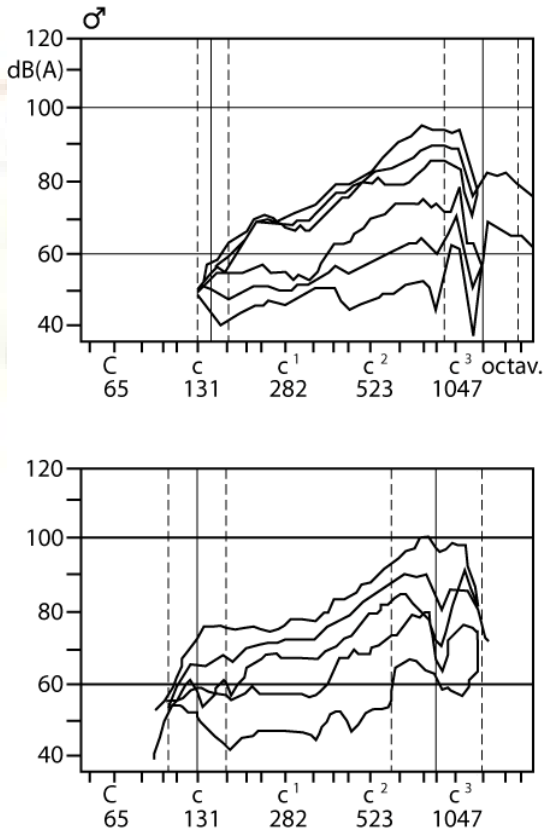


6 phonetograms, measured on a boy at intervals of 2 months (Age 13.7 - 14.6 years). The third phonetogram (December) has the biggest area and shows the smallest irregularities. In January, the boy was suspended from singing in the choir due to the start of the change of voice (C4 = 262 Hz).

M. Pedersen, FRSM Dr.med.Sci. Et h.c. ENT specialist, The Medical centre, Østergade 18 3. DK – 1100 Copenhagen Denmark
Url:www.mpedersen.org

Statistics are necessary!

- The phonetograms of the Thomaner choir are different before puberty and in puberty



Average phonetograms with standard deviation for the cohort of sopranos and of pubertal change groups (mutants) from the Leipzig Thomaner choir. The hormonal parameters were similar to those of the Copenhagen boys.
